

Fork Positioner for Forklifts

Forklift Fork Positioners - The fork positioner is actually a hydraulic apparatus which could allow the the one driving to maneuver the forklift without leaving the seat. They are made out of high quality materials and are designed to withstand the most difficult operations and work environments. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate much more precise carrying and placement in a faster and much more effective method.

The blade pocket is somewhat unique and could enable the operator to be able to securely sway the forks into position without any worry of damaging the positioning cylinders. This can allow the operator the option to execute simultaneous or independent fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into fork positioners on existing units.
